

Tips on using your Tea Light Chandelier efficiently and safely

Thanks for buying one of our tea light chandeliers. They are the most popular Bell Tent accessory we sell and with a bit of common sense it will give you many years of safe light and heat.

Fitting your Tea Light Chandelier to your Bell Tent.

This is the same for any tent with a centre pole. Take the metal chandelier frame and put the pole through it before you tension the tent. Leave it on the floor and only raise it and fit the glass once you have finished erecting the tent.

We always recommend you use a piece of string to hang the chandelier as even though our main poles come with a ring near the top for attaching an inner tent using that directly to hang your chandelier will mean it's way too high up to benefit for the maximum heat and light.

Instead hang the piece of string off the ring and then tie the chandelier to it at whatever height suits. We find that having the bottom tier of the frame about 2 feet from the floor is the optimum for using the light and benefiting from the heat generated by the candles.

Another tip for those with animals or small people is to raise the chandelier up out of reach during the day and only lower it when in use.

Safely using your Tea Light Chandelier

Always have a means of putting out a fire before you use candles in a tent!

Always keep children and animals under control with a flame present and never leave them unattended with the candles lit.

Never hang it over a bed as hot wax hurts and bedding often never looks as good again.

Never try and use it in conjunction with an inner tent. One or the other. We sometimes drop the chandelier frame and put the inner half over it if the bugs attack.

Tips on using your Tea Light Chandelier efficiently and safely. Pg2

Always make sure the tea light candles are level in the glass votive to ensure a slow even burn. If at an angle it will burn out faster and once all the wax is liquid the wick can slip to one edge and burn against the glass. The glass will discolour and occasionally crack with prolonged direct contact with a flame and therefore should be avoided.

We use over 400 of these in our rental stock in Hotel Bell Tent and have vigorously tested them against fire risk. We have found that because the tea light chandelier can move when bumped and more importantly the flames on the candles never stay alight after a 2 ft drop the fire hazard is a lot less than having candles on flat surfaces.

We recommend the purchase of a long necked lighter (sometimes known as a BBQ lighter) as this makes lighting the candle in situ easy and stops hands getting burnt and lit candles being dropped into the votives which often results in an unlevel candle.

We hope you enjoy many years of fun with your Tea Light Chandeliers and consider using it in other places other than just your tent.

Enjoy and contact us if you have any questions. Info@belltent.co.uk 07830 355993
